vibrantlearn. Where we stopped

16 October 2026 - Bipin A + Claude. Everything below is committed in the local git repo (Code/). Nothing is pushed.

1. When you log in again

Open Claude Code in **E:\Startup\VibrantLearn\Code** and say:

```
Read NEXT_SESSION.md, BUILD_PLAN.md and NEXT_STEPS.pdf, then continue from task C3.
```

To show the app: double-click **START-DEMO.bat** in Code/, then open http://localhost:3000 and press *Try the demo*. Once **apps/api/.env** is filled in (section 3), the same script also starts the Python API, and real accounts get server replies.

2. Done and tested

Task	What it does now	Proof
A0	15 Oct security fixes committed; storage-lock migration actually applied (it never had been); 2 unrunnable RLS checks fixed	RLS 37/37 on live DB
A1	Rate limits can't be dodged with a fake x-forwarded-for header	4 tests
A2	Plan updates never use upsert (would fail on permissions)	test
A3	Deleting a session removes its stored files first, then the row	4 tests, migration
B1	A session's chat is in the page HTML on refresh. Fixed bug: heavy users lost their newest messages	SSR test
B2/B3	Signed-in chat is answered on the server and streamed (SSE). Browser can no longer write messages or plans	15 tests, RLS 37/37
C1	Upload links only for allowed types, safe names, 50 MB cap, 20 files / 300 MB per day	14 tests
C2	Uploaded bytes verified: magic bytes, size, SHA-256, zip-bomb + XXE safe, duplicates reused; text extracted and chunked	15 hostile-file tests
E1-E5	Python parser + scheduler (identical to TS on 63 checks), intent model 75% on hand-written holdout, docs/ml-report.md	parity + intent tests

Test totals: web 149 - API 162 (+5 need a database) - RLS 37/37 on the live database - end-to-end demo 17/17.

3. Blocked on you (Bipin) - about 5 minutes

Edit **Code/apps/api/.env** yourself. Never paste these into chat.

Item	Status now	What to do
SUPABASE_SECRET_KEY	Placeholder (only 20 characters)	Supabase -> vibrantlearn-dev -> Project Settings -> API Keys -> copy the secret key
DATABASE_URL	Password is still a placeholder; host says ap-south-1 but the project is in Tokyo	Supabase -> Connect -> Transaction pooler -> copy the whole string, put your DB password in
SUPABASE_URL / JWKS_URL	Fixed (project ref filled in)	Nothing
Groq key	Was posted in chat	Rotate it in the Groq console; put the new one in apps/web/.env.local and apps/api/.env
Real sign-up	Never tested end to end	npm run demo:rebuild, sign up with your email. For others: turn off 'Confirm email' or add SMTP

Without these, uploads, chat for real accounts, quiz scoring and account deletion can only be tested with in-memory fakes, not against the real database and storage.

4. What is left, in order

Task	Work	Notes
C3	Web upload flow: get URL -> PUT bytes -> process -> show status; image OCR in the browser (Tesseract.js eng+kan+hin)	Server half done in C2. OCR needs the CSP widened for language data
C4	Talk to your files: Postgres full-text search scoped to student + session, re-rank, source chips, prompt-injection-safe	Test: user A never gets user B's chunks
D1	Shared LLM cache + usage log	Built in the API (internal.llm_cache, usage_events); still to do: dashboard % from real rows, retire Next /api/notes
D2	AI-written questions, quizzes, flashcards (write -> examiner -> translate)	Fallback to syllabus versions
D3	Quiz scored on the server, stored in quiz_attempts	Tampered client can't fake a score
F1-F5	Limits on everything, real usage meter, account deletion, audit log, forgot password	F3 must leave zero rows and zero files
G1-G2	Composer overlapping the quiz button; copy fixes; hide developer metrics outside the demo	UI polish
G3-G4	Lighthouse >= 90; honest small load test	Record numbers in MEMORY.md
G5	Deploy: two Vercel projects (web + API), production env vars, DEMO_MODE off	Needs your Vercel account (MANUAL_STEPS.md section 4)
G6-G7	Fresh-eyes security review; final docs + feature PDF	Last step

5. The next three steps after you log in

1. Fill in apps/api/.env (section 3). Then run the API tests: `cd apps/api; uv run pytest -q` - the 5 skipped database tests should now run.

2. Tell Claude to continue: it starts with **C3** (wire the upload button for real accounts to the new endpoints), then **C4** (answers from your own notes, with page numbers).

3. Try it for real: sign in with your own account, upload a PDF of your notes, ask a question about it, and check the answer shows the file and page.

6. Good to know

- Demo mode (Try the demo) never touches the database and works without any keys except Groq (for AI notes).
- Database security tests without the Supabase CLI: `python scripts/rls_sql.py` prints a script for the Supabase SQL editor; it reports '37/37 ok' and rolls back.
- The Supabase project is in Tokyo; move it to Mumbai before launch (lower latency for India).
- Kannada/Hindi interface text and AI notes still need a native-speaker check before launch.
